

Industrial Pump Restoration

*“Equipment life and
performance greatly improved*

You give us this, and.....

We bring it back like this!!

Pumps are steel grit blasted to a 5-6 mill profile. The coating process involves three separate steps. First we concentrate on the deepest of the damage to the veins from the destructive forces of cavitation. Deep spots are pre-filled. Next, a coat of resin is applied to the surface of the rotor or pump cavity. Last, we apply second coat of repair material to the entire surface. Your impeller and pump body is now ready to put back into service. Many times less expensive than replacing your pump.
